- Recommended cutting conditions are reference values. Please adjust cutting speed and feed rate according to actual machining conditions taking into account machine and workpiece rigidity
- Do not exceed the maximum cutting speed limit (see page 6)
- Regularly changing the insert screw is recommended
  Use appropriate safety covers to protect from tool breakage and chip scattering
- When using at a higher revolution (10,000min^{-1} or over), refer to the table below to adjust the balance of the MEAS and arbor

Spindle Revolution (min^{-1})	ISO Balance Grade ISO 1940-1/8821 (JIS B0905)

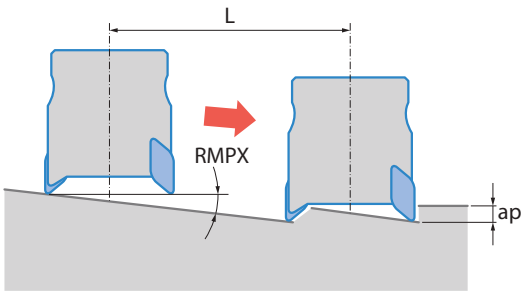
Cutting Dia. DC (mm)	25	28	32	35	40	50
Max. Ramping Angle RMPX	20°	16°	12.5°	11°	8.5°	6°
tan RMPX	0.363	0.287	0.221	0.194	0.149	0.105

Ramping Tips

Recommended ramping angle is ≤ RMPX
(see chart above for recommended ramp angle)
Reduce recommended feed rate by 50%

Formula for Max. Cutting max Length (L) at Max. Ramping Angle

$$L = \frac{ap}{\tan RMPX}$$



Plunging Tips

* Reduce feed rate to fz ≤ 0.1mm/t when plunging

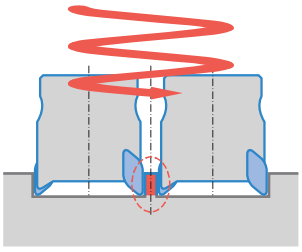
Insert Description	Maximum Width of Cut (ae)
KCGT13 Type	8 mm

Helical Milling Tips

For Helical milling, use between Min. drilling dia. and Max. drilling dia.

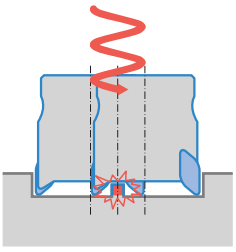
Exceeding Max. Machining Dia.

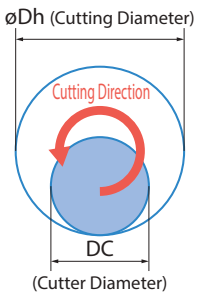
Center Core Remains After Machining



Under Min. Machining Dia.

Center Core Hits Holder Body



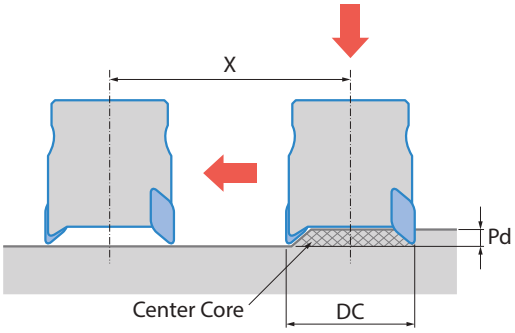


Description	Min. Cutting Dia.	Max. Cutting Dia.	Maximum ramping depth per cycle
MEAS···13···	2×DC-16	2×DC-3	3.5

Unit: mm

- Use climb milling. (Refer to detail on right)
- Feed rates should be reduced to 50% of recommended cutting
- Use caution to eliminate incidences caused by producing long chips

Drilling Tips



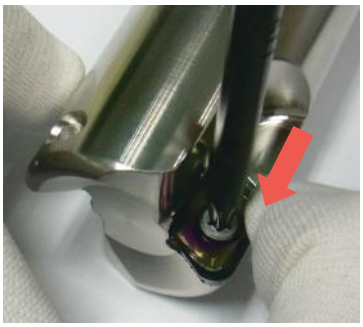
Drilling Depth
Please refer to the figure above (Pd: Max. Drilling depth)
Traversing after Drilling
1. It is recommended to reduce feed by fz = 0.15 (mm/t) or less until the center core is removed
2. Axial feed rate recommendation per revolution is f = 0.1mm/rev or less

Description	Max. Drilling Depth Pd	Min. Cutting Length X for Flat Bottom Surface
MEAS···-13-···	3.5	DC-16

Unit: mm

How to Mount Inserts

1. Completely eliminate chips and dust from the insert mounting side
2. Insert Screw
   - Coat anti-seize compound (P-37) thinly on portion of taper and thread
   - Attach screw to the magnetized wrench tip and tighten while gently pressing the outside edge of the insert toward the insert pocket surface (grooved surface) (see the picture on the right) (Recommended Torque 3.5N·m)



Cautions

While in Use

⚠Caution

Please use within recommended cutting conditions

Do not run the cutter at revolutions exceeding the printed maximum revolution limit of the cutter body

Inserts may be damaged due to the centrifugal force and cutting load

Please do not use under the following conditions:

When cutter is not fully loaded with inserts

If the body is damaged

Please wear protective equipment such as protective glove when changing inserts

Injury can occur when touching the cutting edge

Dynamic Balance

Balance adjustment on the cutter is completed before shipping

Balance adjustment has been made with special high precision inserts to be ISO balance grade (ISO1940/1) G6.3

When using at a higher revolution (10,000min^{-1} or over), refer to the table below to adjust the balance of MEAS and arbor

Do not operate the balance adjustment screw on the outer periphery of the cutter. This could lead to improper dynamic balance.
