

CM Web™

Inventory Management

Optimized for Your Mobile

Workforce

Part of the CribMaster suite of software solutions, CM Web is designed to maximize productivity while on the go. Providing access to your sites' databases from any web-connected desktop, laptop or tablet, CM Web keeps you informed wherever you are. And as a CM Desktop Client user, you automatically have access to CM Web.

The tablet screen shows a data entry form with fields for 'Image Type', 'Machine Type', 'Replacement Frequency', and 'MTT (days)'. Below the form is a table with columns for 'New', 'Project', 'BOM', 'Status', 'Job', and 'BOM'. The table contains several rows of data with green and yellow background colors for different rows.

Solution Generator is the most efficient way to plan vending machine solutions.

Solution Generator ensures a fast and accurate response to, "Which machines do we need?" Using specific details about the items to vend, the Generator calculates the type and number of machines necessary.

- Eliminate manual machine sizing to save significant planning time.
- Assess multiple vending solutions in minutes to choose the best option for maximum ROI.
- Store and reuse item details in a comprehensive repository to expedite new installations.

Import Validator ensures clean data at all times.

Before you populate a database, the Import Validator automatically checks the data against CribMaster rules. The Validator displays a comprehensive list of rule violations and imports the full dataset once all issues are addressed.

- Maintain valid data for employees, crib bins and user-defined fields.
- Identify and resolve all data inconsistencies at once from within the Validator.
- Employ resources more effectively and save time by avoiding inadvertent partial imports.

Dashboards offer you the big picture and give you detailed control.

CM Web includes predefined dashboards and interactive visual charts. Predefined dashboards provide inventory health status at a glance. For more detail, use interactive charts to filter data according to certain parameters.

- View dashboards with real-time inventory snapshots to track dead stock, overstock, out of stock and low stock.
- Customize interactive charts to conduct fine-grained analysis, such as determining employee usage statistics over a defined period. A quick tap opens the linked full report.
- Gain awareness of operational performance both over time and up to the minute.

Customizable reports answer your unique business-critical questions.

CM Web incorporates an advanced reporting engine that allows you to create custom reports from five built-in templates.

- Correlate bin label data, crib bin data, employee data, purchasing data and transaction data.
- Use intuitive drag-and-drop functionality to customize reports, with no programming required.
- Tailor reporting to provide targeted intelligence not found in other reports.

Use Cases

- Achieve visibility and control over your entire organization's indirect material performance – enterprise-wide, by site or by crib.
- Stay up-to-date on inventory status from anywhere through visual dashboards and reporting.
- Manage your inventory while on the go via a user-friendly web interface.
